

## S112—GWR T20, 4 Comp. Centre Brake Third—Guide

To be read in conjunction with the **SHIRE SCENES** Coach and Chassis Guide and the instructions for the Ratio kit. Please read all the instructions and familiarise yourself with the parts and options before bending, gluing or soldering anything. Slower curing 'gel' superglue (applied with a pin?) is recommended. Folding is made easier by lightly scoring along the opposite side from the half etched line with a pointed instrument.

### History

The T20 was an LA9N pattern (Lewis System) vehicle with 24" high windows, 9" deep eaves panels, a single-arc roof and an overall height some 3" lower than the later (after about 1890) three-arc ('elliptical') roof types which were designated LE7N; see the "Coach and Chassis Guide" booklet. They were among the last single arc roof vehicles to be built at Swindon. In order to make them fit the Ratio 610 kit, which is itself LE7N, the etched sides have been stretched. However, It is an attractive and interesting vehicle and modelers might be happy to accept the dimensional discrepancies and the later roof pattern. It is also possible to 'kit bash' the sides to create a more accurate model. To do this the Shire Scenes S114M single-arc coach ends will allow the body to be lowered slightly to give the coach its characteristic 'slumped' appearance when used with taller LE7N compatriots.

### Specific Instructions for Coach Sides and Ends

These sides are intended for use with the Ratio 610 or 612 'short chassis' kits; SR610 and SR612 from Dart Castings. These vehicles had a 19' wheelbase and so the Ratio chassis can be used without modification. If using the ends from the Ratio kit simply complete the brass sides and substitute them for the plastic ones. If using the Shire Scenes S114M coach ends (available separately) follow the instructions for sides and ends in the booklet; note—the floor was designed to mate with thicker plastic ends so there will be a gap. The flanges along the top and bottom of the coach sides (7) and the end 'cheeks' (8) fold through about 180° to thicken the sides and provide faces to mate with the Ratio parts. Short lengths of styrene strip attached along the top of the bottom flange might help alignment of the floor albeit leaving it a little (0.5mm) high (9\*). All 90° folds have the half etched fold line inside the fold. If the under frame is to be detailed, this is best done at the outset as completed coach bodies do not respond well to being inverted and worked on in that position. It is suggested that the coach sides are attached 'second last'; just before the roof. Weighting the vehicle evenly will assist the riding characteristics. Cast metal Passengers; PP1 from Dart Castings, will help with this.

### Livery

Generally, GWR coaches carried the fully lined Brown & Cream livery until 1908 when all over 'brown/crimson lake' was introduced. This lasted until 1922 when the lined livery was re-introduced. Those that lasted into the 1930s would have carried the 'simplified' brown and cream GWR livery. During WW1 a simplified brown livery may have been used.

### Roof

If using the Ratio ends (accepting the wrong roof profile), the Ratio roof can be used end. Remove the plastic moulded gas lamp tops from the roof with a craft knife and sand smooth. If using the Shire S114M ends, a single arc roof will have to be made from a rectangle of styrene sheet 114mm x 36mm. Clamp the plastic rectangle to a large glass jar with rubber bands and 'cook' for 30-60 minutes at 50° in the oven. Drill five holes to accept MJT Gas Lamp Tops (MJT 2945) to align with the centres of the doors.

1. 'T' handles. For door locks\*.
- 2 Droplights and hinges. Hinges fold forward and fit through slots in the coach side (and help locate the droplight). The recess on the back (inside) is to facilitate glazing.
3. Commode handles for outer doors. The handle sits to the left of the mounting holes\*.
4. Upper and lower Guards grab handles. The larger, upper, gently curved, handle goes to the right of the centre door (adjacent to the window) with the longer straight part vertical. The smaller, lower, handle goes to the right of the lower panel in the centre door with the handle to the right of the mounting holes\*.
5. Guard's ducket. The outer edge flanges attach to the back (inside) of the coach side.
6. Door ventilators. Mount in panels above (all) windows)\*.

\*- If modifying a Ratio coach these features can be seen on the discarded side.
